

IVD PROBES

We bring solutions to contamination, sampling accuracy, level sensing, cap piercing, reagent heating and many other diagnostic issues.

Let us offer you

- **To develop together your probe design** : Our 20 years experience in diagnostic problem solving is available to meet your specific technical and cost challengers.
- **Express prototyping** : to quickly test your ideas. A specific team is dedicated to rush your orders, with in-house tubing production, CNC component machining, fabrication and assembly.
- **Full integrated tubing production**, to control the key parameters for the pipette, such as surface finish, dimensional accuracy and material.
- **The smoothest finish**, even inside the smallest probe tip, a key to many contamination problems.
- **Various tip geometries**, optimized for their specific use : micropipetting, non coring cap piercing, multichannel, side hole...
- **A choice of materials**, because stainless steel is not always the best answer to your requirements for corrosion resistance, strenght, magnetism.
- **Surface control** : buffing, electropolishing, dynamic passivation, hydrophobe coatings. We can tightly join fluoropolymer tubes within a metal sheath to combine the surface properties of the former with the strength of the latter.
- **A variety of assembling techniques** : welding : laser, plasma, TIG, resistance/brazing/soldering/ glueing/crimping, etc.
